Salter
Disposable Spirometer

The mouthpiece is designed for maximum patient comfort while at the same time incorporating two one-way valves.

The Salter Disposable Spirometer provides optimal patient protection against cross-contamination as well as providing a one-way valve system for taking a variety of other respiratory measurements. The one-way valve system allows the patient to inhale directly through the mouthpiece, thus making the maneuver easier for the patient and increasing the accuracy of the patient effort.

Features
- Versatile applications
- Inexpensive, single patient use
- 10 liter calibrated collection bag

Benefits
- Ideal for bedside screening, monitoring, or weaning
- Eliminates the threat of cross contamination or expensive sterilization
- Measure volume measurements with relative ease
**Salter Disposable Spirometer P/N 6600**

An economical, single patient use device with multiple applications.

The Salter Disposable Spirometer is used at the bedside to measure pulmonary variables associated with screening, monitoring, and weaning patients. Because of its unique design, Salter Disposable Spirometer replaces the less efficient and non-disposable equipment usually associated with respiratory care. It is neither temperamental, nor expensive as are many other volume collection devices. With the Salter Disposable Spirometer, the clinician can easily and repeatedly monitor life support system volumes, screen patients for therapy, and have an effective means to wean patients by accurately tracking the physiologic parameters. The Salter Disposable Spirometer can be used to determine the following pulmonary data on most patients: VT, VE, VC, FVC, VC/FVC, End Tidal Sampling, Inspiratory and Expiratory Pressures and even mean expiratory flow can be estimated by using a stop watch. Universal adapters permit the above to be measured via mouth, Endotracheal Tube, Tracheostomy Tube, Intermittent Positive Pressure Breathing Machine (IPPB) or Ventilator manifold and Tubing.
